 **STELE**

SKYSAFE®

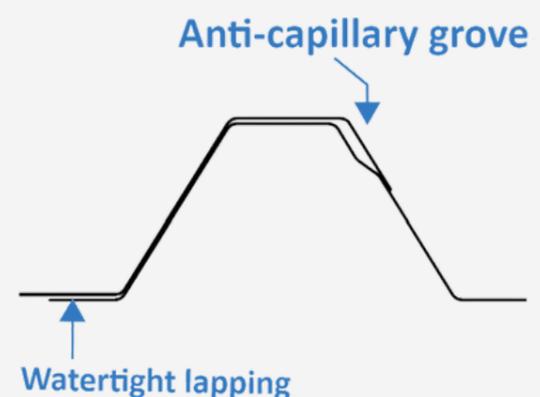

Our versatile corrugated sheets is designed for roof and wall cladding. It features a distinguished 32mm deep corrugation, highest in the Indian Standard, that allows for maximum water drainage capacity. Alongwith, the tri-micro ribbing at every stretch, it outperforms at longer spans with a greater strength-length ratio.

Aesthetics is at the core of Skysafe® and we make our products available in a variety of colors and thickness to match your vision and architectural requirements. Our color coating is formulated with special additives to give UV protection and improved reflectivity.

We provide long-term roofing and cladding solutions that are resilient in the harshest weather conditions, including heavy rain, snow, hail, and high winds.

Our Leakproof design, consists of an anti-capillary groove and a watertight lapping that ensures zero leakage.

Key Features

Greater Strength-Length Ratio

UV Protected Paint

High Wind Tolerance

Leak free Design

Maximum Water Drainage Capacity

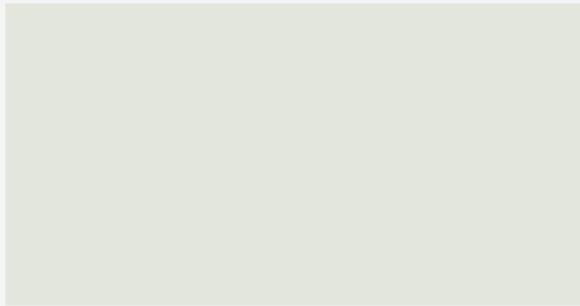

Zero Waste

We use ISI certified Zn-Al coated steel alloy and ensure consistency of the selected base metal surface. Our sheets are finished using a multi-layer coating system involving conversion coating, base primer and uniform top coat with special additives. We deliver optimal properties with a smooth finish UV protection and a high reflective index.

Our standard offering is the AZ70-RMP, however, upon request we work with customized configurations such as AZ150 and SMP, SDP or the PVDF.

Preferred Thickness:-		
High Grade	Fine Grade	Economical Grade
0.60	0.50	0.40
0.55	0.45	0.35
		0.30

Our common accessories:-

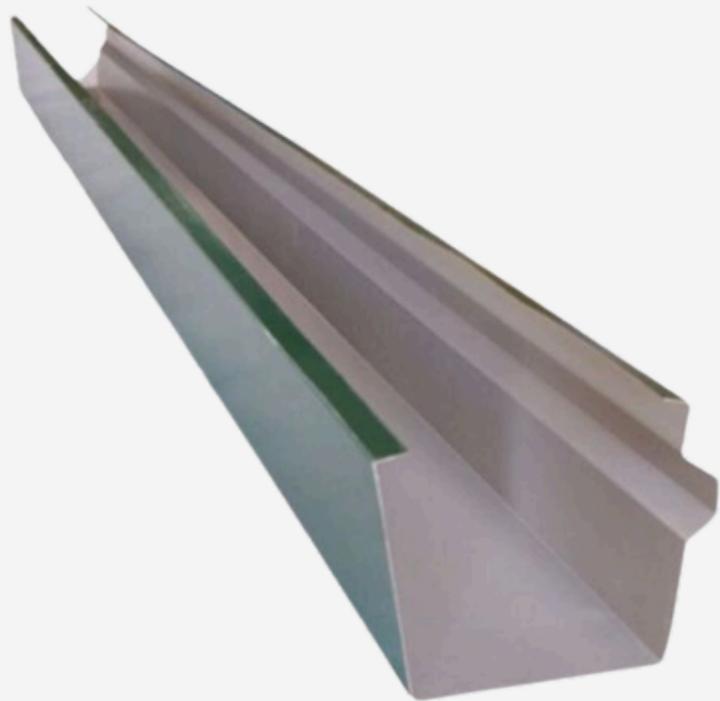

“**Crimped sheets**” refer to metal roofing sheets that have been formed or shaped with a crimping process. Crimping involves creating small, regular folds or bends along the length of the metal sheet. These folds not only add strength and rigidity to the sheet but also contribute to the aesthetic appeal of the roof.

“**Ridge**” refers to the highest point on a roof where two sloping sides meet. The intersection forms a horizontal line or crest, commonly known as the ridge line.

SKYSAFE®

A **gutter** in roofing is a trough or channel installed along the eaves or edges of a roof to collect and redirect rainwater or melted snow away from the building. The primary purpose of gutters is to prevent water from dripping or flowing directly off the roof, which could lead to erosion around the foundation, soil saturation, and potential water damage to the structure.
